

SURFACE PROJECTION

Our **Surface Projection Systems** combine camera and projection tech, and are intended for floors, walls and desks. They track motion, allowing programmed images to respond to a participant's movement. By creating larger-than-life interactive environments, with bespoke content, we provide a fully immersive experience. Surface projection is one of the best solutions for engaging directly with people: it's emotive, interactive, involving and, of course, interactive. Motion is tracked by infra-red sensory technology, reacting in real-time to movement.

We can supply product and also design and implement your content of choice. **Engage** uses a plug & play solution called **Firecube**, which can be installed in minutes. A complete solution, it is housed in a high-quality steel box with a 4,500 ANSI Lumen projector, camera system and a PC.

It's also available as individual components (Firecube Modules), along with a pre-installed PC and a camera system. In both versions the Firecube editor and three full-featured effects are included. Engage can, of course, create any effect you require and will work closely with you to ensure that Firecube's full capacity is realised. You can also control the system remotely via LAN or WLAN.

We recommend Surface Projection for trade fairs, events, roadshows, at the point-of-sale or for showrooms. The system can be employed on a floor, or as an interactive table.
